

Core Switch Board Model

Overview

Includes dual power supplies, hot-swappable modules, link aggregation (LAG), and support for HSRP/VRRP. Modular chassis or stackable designs make it easy to scale as your network grows. 1X support, SNMP, CLI/Web GUI, and network access control. Engineered to aggregate massive volumes of data from distribution switches, it provides ultra-low latency and maximum throughput to ensure uninterrupted routing and packet. A core switch is the backbone of a large-scale network, designed to handle massive volumes of traffic with ultra-low latency and maximum reliability. These networks are designed with three tiers that facilitate strategic installation, management, and maintenance, and so on. The strategic design of a hierarchy network may comprise more than three layers. It is a powerful backbone switch in the center of the network core layer, which centralizes multiple aggregation switches to the core and implements LAN routing. It is mainly responsible for high-speed forwarding and management of large amounts of data traffic from various aggregation layer switches. It usually has powerful processing capabilities, high.
