

Distribution box and switch

Overview

Whereas a distribution box is designed to distribute electricity, a switchboard is used to operate and control electrical devices or processes. You can think of this as the central point where power is distributed to multiple circuits. A distribution board (also known as panelboard, circuit breaker panel, breaker panel, circuit breaker, electric panel, fuse box or DB box) is a component of an electricity supply system that divides an electrical power feed into subsidiary circuits while providing a protective fuse or circuit. Our products range includes simple flush-mounted switch boxes to surface-mounted boxes for indoor use, as well as high-end IP65 junction boxes for use in wet areas. Kopp also offers accessories such as spring covers, screws for switch boxes, and cavity wall switch boxes and plaster adjustment. A distribution box, also known as a distribution board or panel, is the central unit that distributes incoming electrical power to various circuits.
