

Does the optical receiver have an optical output port

Overview

The optical output on your TV is a port designed to send digital audio from the TV to an external device like a soundbar, home theater system, or AV receiver. Look for a small square-shaped port on the back or side of your TV, often labeled: "Digital Audio Out. The optical audio port, also known as TOSLINK, can be useful for connecting older sound systems or linking devices like soundbars to TVs. TOSLINK cables use fiber optic technology to transmit digital audio signals, which makes them distinct from other types of audio cables that use electrical. Initially called Toshiba-LINK, these small-diameter cables don't need electricity to send audio signals from your TV or other source to a speaker. Decades later, Toshiba continued to develop Toslink for automotive entertainment systems, and we can still find optical audio ports in many consumer. An optical audio port is used for the transmission of digital audio data encoded into light signals, which passes through a fiber optic wire. This is dispelled in contrast to the electrical signals passing through copper wires, which are prone to high electrical interference, and therefore, the. To get sound to your cinema system without a TV optical output, you should use an HDMI audio extractor or HDMI ARC. For an audio extractor, connect the TV's HDMI output to the extractor's input, and then connect the extractor's optical output to your sound system. Optical and coaxial digital audio connections offer comparable quality.
