

FBT optical splitter failure

Overview

Splitter failures occur primarily due to mechanical stress and environmental influence, not spontaneous optical breakdown. When splitter modules are mounted without adequate strain relief, tension transfers to internal fiber joints, gradually shifting alignment and increasing. Fiber optic splitters distribute optical power from one input fiber to multiple output fibers through either fused biconical taper (FBT) coupling or planar lightwave circuit (PLC) waveguide structures. Their performance depends on optical symmetry, waveguide integrity, and mechanical stability of. Optical splitters in the outside plant (OSP) are used mostly in passive optical networks (PONs) for fiber-to-the-user (FTTx) networks, and are often overlooked as failure points. Only FBT splitters 1×4 and below are proven to be trustworthy so far. Consequently, they exhibit limited. A passive optical splitter divides an incoming light signal across two or more output ports.
