

Fcdvi interface

Overview

Fiber Distributed Data Interface is a network technology that works on the OSI model's physical and data link layer. It derives its transmission protocol from IEEE 802.4 and follows the ANSI standard X3T9. The FIP provides one high-speed (100-Mbps) FDDI port. FDDI is defined by four separate specifications: Media Access Control (MAC)---Defines how the medium is accessed. This page contains the VCP drivers currently available for FTDI devices. The FDDI will operate at up to two hundred megab ts per second and is designed to be fault tolerant. Currently, the predominant implementation for FDDI networks is in the role of a corporate backbone. The departmental networks in the company attach to the FDDI backbone for high-speed data transfer between. FDDI is frequently used as a backbone technology as well as a means to connect high-speed computers in a local area.
