

Fiber optic connector crack

Overview

To identify scratches and cracks, use a fiber inspection microscope to examine the end face of the connector. Multimode fiber cracking in heat-cured, epoxy and polish connectors results from a combination of the various stresses placed on the fiber during the heat cure and polishing processes used in connectorization. The following is a discussion of the factors that contribute to fiber cracking. In some instances, these can impact reliability when defects are severe enough or located in particularly sensitive areas of the end face. If you properly clean a fiber end-face with lint-free wipes and a specialized solvent designed specifically for fiber cleaning, it's possible to remove contaminants from the fiber end-face. Only by keeping the shape parameters of.
