

Fibre Channel and High Frequency Channel

Overview

Fibre Channel has doubled in speed every few years since 1996. In addition to a modern physical layer, Fibre Channel also added support for any number of "upper layer" protocols, including ATM, IP (IPFC) and FICON, with SCSI (FCP) being the predominant usage. Overview Fibre Channel (FC) is a high-speed data transfer protocol providing in-order, lossless delivery of raw block data. Fibre Channel is primarily used to connect to in (SAN) in co. When the technology was originally devised, it ran over optical fiber cables only and, as such, was called "Fiber Channel". Later, the ability to run over copper cabling was added to the specification. In order to avoid confu. Fibre Channel is standardized in the of the International Committee for Information Technology Standards (), an (ANSI)-accredited standards c.
