

Grounding of the outer sheath of optical cable in the computer room

Overview

Follow these steps at each cable entry point and termination location to achieve a compliant, safe ground bond: Identify metallic components. Strip back approximately 6–8 inches of the outer jacket using a cable splitter or ringing tool. Visually identify armor, strength members, or. Fiber optic cable transmits data as light through glass or plastic strands, which means the fiber core itself carries no electrical current and requires no grounding. The critical distinction lies in. Grounding of cable shield or outer sheath at both ends can results in circulating currents that may require cable derating, depending on the cable length and construction. A table is provided by ANSI/IEEE 525 recommending the maximum lengths of single point shield grounding. Operational grounding rules, especially for medium and high-voltage grids, may vary according to each country's regulations. Refer to Table 1 for kit part numbers.
