

# How much load does the secondary distribution box in Tuvalu have

## Overview

Since distribution transformers are energized 24 hours a day (even when they don't carry any load), reducing iron losses is vital in their design. They usually don't operate at full load, so they are designed to have maximum efficiency at lower loads.

Overview A distribution transformer or service transformer is a that provides a final reduction in the system, stepping down the voltage used in the distribution lines to the level used. Distribution transformers are classified into different categories based on factors such as:

- Mounting location - pole, pad, underground vault
- Type of insulation - liquid-imme.

Distribution transformers are normally located at a, where wires run from a utility pole or underground power lines to a customer's premises. They are often used for the power supply of facilities outside sett.

Distribution transformer

OverviewTypesUseConnectionsConstructionPlacementBibliography

A distribution transformer or service transformer is a transformer that provides a final voltage reduction in the electric power distribution system, stepping down the voltage used in the distribution lines to the level used by the customer. The invention of a practical, efficient transformer made AC power distribution feasible; a system using distribution transformers was demonstrated as early as 1882.
