

How to calculate BT relay protection

Overview

Use this Protection Relay Setting Calculator to calculate pickup current, time multiplier settings (TMS), operating time, coordination time interval (CTI), and plug setting multiplier (PSM) using fault current, CT ratio, and IEC 60255 curve parameters. This technical report refers to the electrical protections of all 132kV switchgear. All calculations are based on the available documentation/ information. Proper relay settings allow protection devices to detect abnormal conditions accurately and isolate the faulty element swiftly, minimizing the impact on the broader system. In this article, we will explore the fundamental concepts, procedures, and practical considerations involved in calculating. Modern relays often have algorithms that enhance the security of elements that are otherwise susceptible to current transformer (CT) saturation. We use CT models verified using.
