

Huawei switch access port

Overview

To enable a port on a Huawei switch, start by accessing the device's command-line interface (CLI) via a console cable or SSH. Use the system-view command to enter configuration mode, then navigate to the target port using interface GigabitEthernet 0/0/1 (replace with your port ID). Traffic is both received and sent in native formats with no VLAN tagging whatsoever. Anything arriving on an access port is simply assumed to. After a PC is connected to a switch through a dedicated console cable, you can perform login configurations and use the PC to manage the switch. For the test, I will execute commands on the Huawei Quidway S2326TP-EI. For example: Replace USERNAME with the new username, set the password, define service-type (telnet, ssh, etc).
