

Introduction to Access Layer Switches

Overview

In a typical enterprise network architecture, the access layer switch is the first point of contact between end-user devices and the rest of the network. It assists mainly in the switching of incoming and outgoing data packets to. The term campus LAN refers to a LAN network that spans a single geographic location, such as a building or university campus. A campus LAN can be an entire network or part of an enterprise network. A Layer 2 access topology provides the following unique capabilities required in the data center: VLAN extension—The Layer 2 access topology provides the flexibility to extend VLANs between switches that are connected. When choosing access layer switches, there are many points to consider, such as port density, port speed, security, scalability, deployment and management methods, as well as cost. Port density refers to the number of ports available on a single switch.
