

Maintenance of ADSS optical cable OM5

Overview

ADSS installation requires careful planning, correct tension settings, and smart hardware use. These steps help prevent breaks and signal loss. Corning® ClearCurve® OM5 wide band optical fiber is designed to support Wavelength Division Multiplexing (WDM) operation over 850 – 953 nm wavelengths while offering the same bandwidth specifications at 850 nm as Corning® ClearCurve® OM4 optical fiber. Many engineers trust these methods to ensure stable performance over long spans. Small oil micro-deposits and dust particles on fiber optic cable optical surfaces may cause a loss of light or degraded signal power which may ultimately cause intermittent problems in the optical connection. Figure 1 shows the oil and dust that can collect on fiber cable connector tips and canals. The installation methods for ADSS cables are essentially the same as those used for. Today we share with you will The following issues need to be paid attention to during the installation and maintenance of ADSS self-supporting optical cables: 1.
