

Melting point of the black adhesive for optical modules

Overview

Mid-range melting point of 165 °F (74 °C). Provides excellent adhesion and minimizes clogging of diamond tools when compared to many waxes. Transparent in thin cross-sections. Optical adhesives are supporting advances in optical assemblies, collections of optical components and mechanical parts that precisely manipulate light for focusing, imaging, and beam shaping. It is a widely used fiber-optic grade epoxy. 1-978-667-3805 to discuss packaging options. EPO-TEK® 320 is a black, opaque, optical epoxy designed for optoelectronic. The EPO-TEK® 320 Thixotropic Optical Epoxy Adhesive is a two-component, low viscosity and optically opaque epoxy designed for optical, medical, and opto-electronic packaging of semiconductor devices and components. The adhesive has the unique flexibility to cure in seconds with LED and/or UV/Visible light as. Optical switches and wiring switching products that enable labor savings and advanced operation of optical networks. From research and development to mass production evaluation, we measure light and verify performance.

Optical adhesives

The encapsulation of LEDs, termination of optical fibres and assembly of complex lens systems are all tasks that can be accomplished by the use of special optical adhesives, explains Neil Savage.

Hot Melt Adhesive (HMA)

Thanks to the fast-setting speed, relatively low cost (materials and processing), and low environmental impact, hot melt adhesives are widely used

Introduction To The COB Process For Optical Modules

In recent years, the COB (Chip-on-Board) process has been frequently mentioned in the context of high-speed optical modules. The COB process refers to a technology that directly mounts
