

# Optical Wavelength Division Multiplexing Transmission System

## Overview

Normal WDM (sometimes called BWDM) uses the two normal wavelengths 1310 and 1550 nm on one fiber. Dense WDM (DWDM) uses the C-Band (1530 nm-1565 nm) transmission window but with. In fiber-optic communications, wavelength-division multiplexing (WDM) is a technology which multiplexes a number of optical carrier signals onto a single optical fiber by using different wavelengths (i. The "basie" transmission rate of SONET is 64 kbps for supporting voice communications. SONET multiplexes large numbers of 64-kbps channels onto higher-rate datastreams. The article explains the fundamental principle and its. Wavelength division multiplexers are fundamental to the functioning and performance of integrated photonic circuits, with applications ranging from optical interconnects to sensing and quantum technologies. It can perform additional roles like providing redundancy, supporting advanced topologies, reducing hardware and cost, etc.
