

Outdoor High Voltage Common Phase Busbar

Overview

In HV and EHV installations and in outdoors MV installations bare busbars and connectors are used and the conductors may be tubular or stranded-wires. A conductor or group of conductor used to collect the power from incoming feeders and distribute to the outgoing feeders is known as busbar. In cooperation with the customer, these can also feature TE's Bus Bar Insulation Tubing (BBIT). Busbars provide a safe HV connection on shorter distances. The current rating is calculated from the conductor cross-sectional area, material (copper or aluminium), and maximum. This article provides a comprehensive overview of busbars, covering their construction, function, classification, selection, and applications in high-voltage power systems. Construction and Working Principle of Busbars Busbars are constructed from conductive metal bars, typically made of copper. The International Electrotechnical Commission (IEC) issues globally accepted standards that promote safety and efficiency in electrical engineering. For busbar sizing, the primary references are IEC 61439 (for low-voltage switchgear and controlgear assemblies) and IEC 60287 (for current-carrying).
