

Outdoor fiber optic cables must not be bent

Overview

The cable should be bent as little as possible. If the cable remains outside for more than 24h during installation protective material should be used to prevent cable. All fiber optic cables have specifications that must not be exceeded during installation to prevent irreparable damage to the cable. Fiber optic cable bend radius is a critical mechanical parameter that determines how sharply a cable can be bent without risking microbending, macrobending, signal loss, or long-term structural fatigue. The minimum bend radius defines the smallest. Segregate fiber optic cable from heavy copper cables to avoid bend radius violations and crush loads. Comply with National Electrical Code requirements for cable ratings and fire safety.
