

Storage connected to FC fiber optic switch

Overview

The SAN network adopts Fibre Channel technology, which is connected to the storage array and server host through optical switches to establish a dedicated data storage area network. If multiple servers and storage arrays are not involved, you can directly connect. A Fiber Channel SFP is a specialized optical transceiver designed exclusively for Fiber Channel (FC) networks, enabling high-speed, low-latency, and lossless data transmission in Storage Area Network (SAN) environments. Only the QFX3500 switch has native FC ports and supports native FC connection to the SAN. This section provides introductory information about how to use with Fibre Channel SAN. It acts as the key interface between Fibre Channel-specific devices—such as FC switches, host bus adapters (HBAs), and storage. Fibre Channel (FC) has long been a trusted choice in enterprise datacenters for its reliability, performance, and low latency. While Proxmox VE (Virtual Environment) is best known for its support of Ceph, iSCSI, and NFS, it also works seamlessly with Fibre Channel when configured correctly at the.
