

Switch MAC address cannot be connected

Overview

Generally, MAC address flapping is caused by loops. You can run the loop-detect eth-loop command in the VLAN view to enable the MAC flapping detection function. I have successfully setup the dynamic VLAN assignment, however the switch connected to and providing services to my test switch does not populate the mac address but my test switch does. To troubleshoot this I put it back on port security and the MAC wont even populate on the test switch its. What does it mean when a switch doesn't learn the MAC address of the connected device?
