

Telecom Optical Module Board

Overview

Optical module circuit boards, also called optical module PCB s, are circuit boards used in optical fiber communication devices. Whether you are creating a 100-Gbps or 400-Gbps, small form-factor pluggable (SFP) module, SFP+ transceiver, XFP module, CFP, X2/XENPAK module. The Printed Circuit Board (PCB) at the heart of these modules is no longer a simple substrate but a highly engineered system. Designing and producing these complex PCBs presents formidable challenges, requiring a convergence of disciplines—from high-frequency signal integrity and advanced thermal. A telecom board supports signal transfer, power control, data exchange, and network communication inside telecom equipment. It may look like a common PCB, but it often needs tighter control over layout, materials, impedance, assembly, and testing. Therefore, engineers and buyers should understand. AIVON telecommunication PCBs are high-performance boards designed for fast and stable signal transmission. Deployed across fronthaul, midhaul, and backhaul.
