

The SFP interface can accept SFP optical modules

Overview

As a hot-pluggable / hot-swappable I/O device, it supports both RJ45 and fiber type modules, extending the flexibility beyond RJ45 and fixed fiber ports in practical applications. An SFP interface on networking hardware is a modular slot for a media-specific transceiver, such as for a fiber-optic cable or a copper. SFP (Small Form-factor Pluggable) is a hot-pluggable network interface module used in the network devices of today's computer networks. Transceiver compatibility is a key concern in enterprise network deployments. Think of it as the “translator” for your network equipment, converting electrical signals into optical signals. The SFP+ port is a high-speed optical-to-optical signal conversion port, mainly used for 10G Ethernet and Fiber Channel network applications. A key advantage of SFP+ Modules is that they are "hot-swappable", meaning they can be swapped out while the router is still powered on.
