

Which splitters does the fiber optic cable pass through

Overview

An optical coupler is a passive device that can split or combine signals in optical fibers. They are named by the number of inputs and outputs, so a splitter with one input and 2 outputs is a 1X2, and a PON splitter with one input and 32 outputs is a 1X32. Imagine you have a single fiber cable bringing blazing-fast internet to your home or office, but you want to connect multiple devices or rooms. Its primary role is in Passive Optical Networks (PON), which are the foundation of. A fiber-optic splitter, also known as a beam splitter, is based on a quartz substrate of an integrated waveguide optical power distribution device, similar to a coaxial cable transmission system. The optical network system uses an optical signal coupled to the branch distribution.
